

Fileshare Migration Manager

Migrate corporate file shares, web-based document repositories, and personal drives to SharePoint

Business Benefits

- > Reduce migration costs by up to 90%
- > Accelerate your fileshare consolidation
- > Make your document assets more searchable
- > Maximize your investment in existing content

Features

- > Crawl and inventory your files
- > Analyze your content
- > Mine out and enrich document metadata
- > Auto-generate sites and folder hierarchies
- > Develop custom transformations
- > Delegate metadata attribution tasks to content owners

Key Features

> Crawl and inventory your files

The first step in a file share migration is knowing what you have that is important. Migration Manager allows you to quickly generate a complete list of all the documents living on your network file shares, websites, and personal drives.

> Analyze your content

Powerful filtering, sorting, and visualization tools allow you to identify the important aspects of your existing document content, such as hierarchies, authorship, subjects and categories. These tools allow you to make more informed decisions when organizing your target SharePoint sites.

> Mine out and enrich document metadata

Valuable metadata locked within your Office documents can be automatically mined-out and promoted to columns where it becomes more visible. Using powerful tagging tools, additional metadata can be added to enrich your files, facilitating better categorization and searchability.

> Auto-Generate sites and folder hierarchies

Automatically build out SharePoint sites and folder hierarchies using existing document metadata.

> Develop custom transformations

For complex migration scenarios, Migration Manager has a built-in actions framework, allowing developers to write custom transformations.

> Delegate metadata attribution tasks to content owners

Content owners often need to provide input about what metadata needs to be updated or added to files being migrated to SharePoint. FSMM provides the ability to export content and metadata sub-sets to spreadsheets for distribution to content owners. After the content owners have attributed any required metadata, these spreadsheets can be re-imported and the specified metadata migrated to SharePoint along with associated files.

Migration Products

- SharePoint Site Migration Manager
- FileShare Migration Manager for Sharepoint
- Website Migration Manager for SharePoint

Archiving Products

- Professional Archive Manager for Exchange
- Professional Archive Manager for SharePoint
- Professional Archive Manager for Files

Restoration Products

- Selective Restore Manager for SharePoint Backups
